Lyapunov exponents and nonuniform hyperbolicity

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Let $F : M \rightarrow M$ be a smooth diffeo. of a compact manifold M , $\dim M \geq 2$.

Question

When is

$$\lambda_1(p) := \limsup_{n \rightarrow \infty} \frac{1}{n} \log \|dF_p^n\| > 0$$

for a **positive volume** subset of $p \in M$?

Lyapunov exponents and nonuniform hyperbolicity

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Let $F : M \rightarrow M$ be a smooth diffeo. of a compact manifold M , $\dim M \geq 2$.

Question

When is

$$\lambda_1(p) := \limsup_{n \rightarrow \infty} \frac{1}{n} \log \|dF_p^n\| > 0$$

for a **positive volume** subset of $p \in M$?

- Positive Lyapunov exponent \Rightarrow sensitivity to initial conditions

Lyapunov exponents and nonuniform hyperbolicity

Random perturbations of predominantly hyperbolic systems

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Let $F : M \rightarrow M$ be a smooth diffeo. of a compact manifold M , $\dim M \geq 2$.

Question

When is

$$\lambda_1(p) := \limsup_{n \rightarrow \infty} \frac{1}{n} \log \|dF_p^n\| > 0$$

for a **positive volume** subset of $p \in M$?

- Positive Lyapunov exponent \Rightarrow sensitivity to initial conditions
- **Nonuniform hyperbolicity**: first step towards ergodic components, mixing properties, limit laws, etc...

Challenges

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

Estimating LE is a **delicate** cancellation problem:

- Growing vectors 'twisted' into contracting directions
- Dissipative: presence of sinks of high period
- Conservative: elliptic islands

Challenges

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

Estimating LE is a **delicate** cancellation problem:

- Growing vectors 'twisted' into contracting directions
- Dissipative: presence of sinks of high period
- Conservative: elliptic islands

Obstructions are real:

- **Dissipative:** coexistence of wild hyperbolic sets and infinitely many sinks (Newhouse 74)
- **Conservative:** For Chirikov standard map, proliferation of elliptic islands for large set of L (Duarte 95)

Existing positive results

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Dissipative:

- Dynamics of Hénon map in (Benedicks & Carleson 91)
- One direction of instability (Wang & Young 01, 08)

Results entail **intensive** parameter exclusion to rule out bad behavior, e.g., formation of sinks.

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Existing positive results

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Dissipative:

- Dynamics of Hénon map in (Benedicks & Carleson 91)
- One direction of instability (Wang & Young 01, 08)

Results entail **intensive** parameter exclusion to rule out bad behavior, e.g., formation of sinks.

Conservative:

- (Gorodetski 12) Chirikov standard map: $\lambda_1 > 0$ on set of Hausdorff dimension 2 (zero volume)

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Our goal:

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

Natural way of making problem tractable: small random perturbations “unlock” hyperbolicity

- Seek broad applicability: use only ‘rough’ geometry of hyperbolicity
- Look for checkable conditions: verifiable from **finitely** many iterates

Not unrealistic: real world is inherently noisy

The Model: maps with “Hénon flavor”

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

Write $\mathcal{C} = \mathbb{S}^1 \times \mathbb{R}$ for the cylinder.

- Let $\psi : \mathbb{S}^1 \rightarrow \mathbb{R}$ be C^3 ;
- let $a \in \mathbb{S}^1, b \in (0, 1], L > 1$.

Define $F : \mathcal{C} \rightarrow \mathcal{C}$ by

$$F_{\psi, L, a, b}(x, y) := (f_{\psi, L, a}(x) - y, bx).$$

where $f_{\psi, L, a} := L\psi(x) + a$.

The Model: maps with “Hénon flavor”

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

Write $\mathcal{C} = \mathbb{S}^1 \times \mathbb{R}$ for the cylinder.

- Let $\psi : \mathbb{S}^1 \rightarrow \mathbb{R}$ be C^3 ;
- let $a \in \mathbb{S}^1, b \in (0, 1], L > 1$.

Define $F : \mathcal{C} \rightarrow \mathcal{C}$ by

$$F_{\psi, L, a, b}(x, y) := (f_{\psi, L, a}(x) - y, bx).$$

where $f_{\psi, L, a} := L\psi(x) + a$.

Note: F discontinuous along $\mathcal{D} = \{x = 0\}$ if $b < 1$.

Properties of F

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

F is *predominantly hyperbolic* when $L \gg 1$:

- Everywhere $\det dF \equiv b$.
- Outside *critical strips* (shaded), dF expands in horizontal cone to order L .
- Width of critical strips is $O(L^{-1})$.

Introducing the random model

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Introduce IID random perturbations:

$$F_{\omega}(x, y) = F(x + \omega, y)$$

$$F_{\underline{\omega}}^n := F_{\omega_n} \circ \dots \circ F_{\omega_1}$$

Here $\underline{\omega} = (\omega_1, \omega_2, \dots)$, where $\omega_i \sim \text{Unif}[-\epsilon, \epsilon]$ are IID.

- Heuristically: randomness helps avoid obstructions by “smearing” away
- Not so unnatural: real world is inherently noisy!

Formulation of problem

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

“Large” perturbations: when $L \gg 1$, $\epsilon \approx 1$, simple exercise to show

$$\lambda_1^\epsilon(\rho) \approx \log L.$$

Formulation of problem

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

“Large” perturbations: when $L \gg 1$, $\epsilon \approx 1$, simple exercise to show

$$\lambda_1^\epsilon(p) \approx \log L.$$

Question:

For a given (possibly large) L , how small can ϵ be for randomness to ‘unlock’ hyperbolicity of F ?

Results: volume-preserving ($b = 1$)

Theorem (Joint with JX, LSY; Ann. Math.)

Assume ψ satisfies some (checkable) nondegeneracy conditions. Then there exists $L_0, c > 0$ such that for any $L \geq L_0$ and

$$\epsilon > L^{-cL^{9/10}},$$

the top Lyapunov exponent $\lambda_1^\epsilon(p) = \lim_{n \rightarrow \infty} \frac{1}{n} \log \|(dF_\omega^n)_p\|$ exists, is almost surely constant over p, ω , and satisfies

$$\lambda_1^\epsilon \geq \frac{9}{10} \log L.$$

Random perturbations of predominantly hyperbolic systems

Alex Blumenthal; joint work with Jinxin Xue and Lai-Sang Young

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Results: volume-preserving ($b = 1$)

Random perturbations of predominantly hyperbolic systems

Introduction

The model

Main problem: LE

Results I: LE ($b = 1$)

Results II: LE and DoC ($b \leq 1$)

Conclusion

Theorem (Joint with JX, LSY; Ann. Math.)

Assume ψ satisfies some (checkable) nondegeneracy conditions. Then there exists $L_0, c > 0$ such that for any $L \geq L_0$ and

$$\epsilon > L^{-cL^{9/10}},$$

the top Lyapunov exponent $\lambda_1^\epsilon(p) = \lim_{n \rightarrow \infty} \frac{1}{n} \log \|(dF_\omega^n)_p\|$ exists, is almost surely constant over p, ω , and satisfies

$$\lambda_1^\epsilon \geq \frac{9}{10} \log L.$$

Corollary

Theorem applies to Chirikov standard map

$$F(x, y) = (L \sin(2\pi x) + 2x - y, x).$$

Comments on Theorem

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

- No assumptions made on detailed dynamics of F :
 - Elliptic fixed points and periodic points allowed.
 - Typical length T of sojourn to vicinity of elliptic fixed point:

$$T \approx \epsilon^{-1} = L^{cL^{9/10}}.$$

Comments on Theorem

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

- No assumptions made on detailed dynamics of F :
 - Elliptic fixed points and periodic points allowed.
 - Typical length T of sojourn to vicinity of elliptic fixed point:

$$T \approx \epsilon^{-1} = L^{cL^{9/10}}.$$

- By precluding elliptic orbits of period ≤ 3 , we can allow

$$\epsilon > L^{-cL^{19/10}}.$$

- Consistent with parameter exclusion ideas in [BC], [WY].

LE and decay of correlations ($b \leq 1$)

Random

joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

- No assumptions on detailed dynamics of F -sinks could exist!
 - Sinks have basins of size $O(L^{-1})$; perturbations are just large enough **to escape with high probability**

Comments on Theorem

Random
perturbations
of
predominantly
hyperbolic
systems

Alex
Blumenthal;
joint work
with Jinxin
Xue and
Lai-Sang
Young

Introduction

The model

Main problem:
LE

Results I: LE
($b = 1$)

Results II: LE
and DoC
($b \leq 1$)

Conclusion

- No assumptions on detailed dynamics of F -sinks could exist!
 - Sinks have basins of size $O(L^{-1})$; perturbations are just large enough **to escape with high probability**
- Precluding sinks of period ≤ 3 permits us to take $\epsilon \geq L^{-19/10}$ instead.
