New concepts such as shape properties are accompanied with an application. Example: If two chords intersect inside a circle the product between the 2 segments on one chord is equal to the product of the 2 segments on the other chord: \( AM \times MB = MC \times MD \)

Application:

An arched bridge is made of a circular arc \((AB)\) and eleven equally distanced vertical supports. The arc is 2.4 m high at its highest point \((x=2.4)\). Determine the radius of the arc. Hint: extend the arc into a circle and use the intersecting chords property.
Building application- Foundation Plan

An important aspect of architectural and building design involves quantity take-offs from drawings. Calculations involving both perimeter and area are often involved in quantity take-offs.

Examples
The dimensions to the outside walls of a house are given here, as well as a cross-section through the footing.

a. Determine the area of the floor slab.

b. Determine the length of perimeter drain tile required for this project.

c. Determine the area of the formwork required to pour the foundation wall, given that the wall height is 2' 6"
Determine the area of roofing required to cover the roof shown here.

For the symmetrical cross-gable roof pictured here,

Draw the top view and front view.

Given the dimensions below, determine the total roof area. Note that the building is built on level ground and the ridge beams KC and GM are horizontal.

Dimensions:

- GH=GN=29ft  CX=62ft
- EH=NF=6ft  AB=40ft
- GM=65ft  CD=CP=30ft
- EF=40ft  AD=PB=3ft
Percentages are often used to describe the slope of ramps. Recall that a percentage is a ratio of one number over 100. A slope of 15% means that the ramp rises 15 units vertically for every 100 units horizontally that it spans.

In the wheelchair ramp shown here, the grade of the ramp is not to exceed 8%. If it must rise 16", how far before the first step does it need to start? What is the sloped length of the ramp? The stairs are 12" deep.
Area of basic shapes:
A Persian decorative Motif (from Sheikh Lutfullah Mosque-Isfahan) is created as described here:

<table>
<thead>
<tr>
<th>Design steps: start with 7 congruent tangent circles, R=10 cm</th>
<th>Next, some arcs are selected as shown:</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Design steps" /></td>
<td><img src="image" alt="Next, some arcs" /></td>
</tr>
</tbody>
</table>

Final Motif:

<table>
<thead>
<tr>
<th>Final Motif:</th>
<th>The motif with biomorphs drawn in it:</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Final Motif" /></td>
<td><img src="image" alt="The motif with biomorphs" /></td>
</tr>
</tbody>
</table>

Determine the area of the blue region:
Pyramid house, designed by Mexican architect Juan Carlos Ramos is in the shape of a right, square based pyramid where the lateral walls are equilateral triangles. One face of the pyramid is completely encased in glass (after applying an inward offset of 0.2m). The side length of the base square is 1.98m. Determine:

1) The area of the glass covered surface (shaded region)
2) Volume of the pyramid.
This small pavilion is built to stand as a doorway to the design and architecture exhibition ‘Casa Cor MG 2015’ in Belo Horizonte, Brazil. The radius of the small circle is 120cm and the radius of the big circle is 150cm. The centers of the two circles are 215 cm far apart. The straight lines MK and PN are tangent to the circles. Determine the perimeter of the shape. Express the perimeter in meters correct to four significant figures.

A vertical cross section of the building is pictured here.
Cairo tiles: Several streets of Cairo, Egypt are tiled with this particular pentagonal tile known as Cairo tile. What can we deduce about angles and sides of each pentagonal tile? Note how the tiles can be placed next to each other, forming a hexagon.

© Helen Donnelly

The picture shows the world renowned Anishinaabe architect, Douglas Cardinal in the foyer of the First Nations University of Canada, which he completed in Regina in 2003.

After gaining national fame in the late 1960s for designing St. Mary’s Roman Catholic Church in his hometown of Red Deer, Alberta, Cardinal designed several international landmarks, including the 1989 Museum of History in Ottawa and the conceptual design for the National Museum of the American Indian in Washington, D.C., completed in 2004. Through dozens of other projects of every size and genre, Cardinal has embedded his Indigenous values in his work. He is considered one of Canada’s most influential contemporary Indigenous architects.

For this group project, measure the dimensions of the glass tent/cone by using the provided ruler. Assume that Douglas Cardinal's height is approximately 178 cm (this is just an assumption, not a fact). Estimate the amount of glass needed for the conic entrance of the building shown in the photo. You may ignore the thickness of the steel bars used to hold the cone in place.
